## **AMENDMENTS TO THE CLAIMS**

A capsule filling machine [[(100)]] for the production of

Please amend the Claims as follows:

(Currently Amended)

1.

producing hard gelatin capsules, (C) of the type with each capsule having a lid [[(3)]] and a body [[(2)]] containing a quantity [[(1)]] of pharmaceutical material, the machine [[(100)]] comprising a rotary turret or carousel [[(15)]] which defines at least one capsule [[(C)]] handling line [[(L)]] and on which the following are positioned, one after the other: at least one station [[(6)]] for feeding empty capsules [[(C)]]; at least one opening station [[(20)]] where the capsule bodies [[(2)]] are separated from the lids [[(3)]] to form two

capsule bodies [[(2)]]; and at least one station [[(8)]] for closing the capsules [[(C)]] by placing [[a]] the respective [[(3)]] over each respective body [[(2)]]; wherein the

separate rows of capsule bodies [[(3)]] and lids [[(2)]]; at least one station [[(7)]] for

feeding and dosing the quantities [[(1)]] of pharmaceutical material to be filled into the

machine (100) being characterised in that it further comprises means [[(9)]] for detecting

and volumetrically checking the quantity [[(1)]] of pharmaceutical material filled into each

capsule body [[(2)]], the detecting and checking means [[(9)]] comprising transducer

means [[(5)]] for measuring [[the]] a volume of said quantities [[(1)]] before they are

inserted into the capsule bodies [[(2)]].

2. (Currently Amended) The machine according to claim 1, characterised in that wherein the checking means [[(9)]] also comprise a dose checking disc [[(11)]]

coupled with the carousel [[(15)]]; the disc [[(11)]] having made in it at least one series of

dosing chambers [[(4)]] of predetermined size (H, D), inside each of which the quantity

Application Number: 10/568,506 Attorney Docket Number: 023349-00315 [[(1)]] of pharmaceutical material is temporarily placed; the transducer means [[(5)]] being designed to operate in the chambers [[(4)]] to measure the volume of the quantities of pharmaceutical material before they are inserted into the respective capsule bodies [[(2)]].

- 3. (Currently Amended) The machine according to claim 1, characterised in that wherein the transducer means [[(5)]] comprise elements [[(13)]] for detecting the quantities [[(1)]] of pharmaceutical material.
- 4. (Currently Amended) The machine according to claim 2, characterised in that wherein each chamber [[(4)]] is designed to be closed at the bottom by reciprocating contact elements [[(10)]] moving towards and away from the carousel [[(15)]].
- 5. (Currently Amended) The machine according to claim 1, characterised in that wherein the transducer means [[(5)]] are connected to a control and processing unit [[(18)]] designed to receive a signal [[(S)]] from the transducer means [[(5)]] themselves.
- 6. (Withdrawn) A method for producing hard gelatin capsules (C) of the type with lid (3) and body (2) containing a quantity (1) of pharmaceutical material, the method comprising the steps of; feeding closed empty capsules (C) to an opening station where the capsule bodies (2) are separated from the lids (3) to form two separate rows of capsule bodies (2) and lids (3); filling each capsule body (2) with a predetermined quantity (1) of

pharmaceutical material; and closing the capsule bodies (2), filled with the quantities (1), by placing the lids (3) over the respective bodies (2); the method being characterised in that it further comprises a step of detecting and volumetrically checking the quantity (1) of pharmaceutical material, this step being performed before each quantity (1) of pharmaceutical material is inserted into the respective capsule body (2).

- 7. (Withdrawn) The method according to claim 6, characterised in that the detecting and checking step comprises the step of holding said quantities of pharmaceutical material inside dosing compartments or chambers (4) of predetermined volume and of measuring the height (H1) of the quantities (1) inside the chambers (4) themselves.
- 8. (Withdrawn) The method according to claim 7, characterised in that the measurement of the height (H1) is performed by linear transducer means (5).
- 9. (Currently Amended) The machine according to claim 2, characterised in that wherein the transducer means [[(5)]] comprise elements [[(13)]] for detecting the quantities [[(1)]] of pharmaceutical material.
- 10. (Currently amended) The machine according to claim 2, characterised in that wherein the transducer means [[(5)]] are connected to a control and processing unit [[(18)]] designed to receive a signal [[(S)]] form the transducer means [[(5)]] themselves.
- 11. (Currently Amended) The machine according to claim 3, characterised in

that wherein the transducer means [[(5)]] are connected to a control and processing unit [[(18)]] designed to receive a signal [[(S)]] form the transducer means [[(5)]] themselves.

12. (Currently Amended) The machine according to claim 4, characterised in

that wherein the transducer means [[(5)]] are connected to a control and processing unit

[[(18)]] designed to receive a signal [[(S)]] form the transducer means [[(5)]] themselves.

13. A capsule filling machine for producing hard gelatin capsules, each (New)

capsule having a lid and a body containing a quantity of pharmaceutical material, the

machine comprising a rotary turret or carousel which defines at least one capsule

handling line and on which the following are positioned, one after the other: at least one

station for feeding empty capsules; at least one opening station where capsule bodies

are separated from lids to form two separate rows of capsule bodies and lids; at least

one station for feeding and dosing the quantities of pharmaceutical material to be filled

into the capsule bodies; and at least one station for closing the capsules by placing a lid

over each respective body; wherein the machine further comprises a transducer

element for measuring a volume of said quantities before they are inserted into the

capsule bodies, wherein the transducer element comprises a sliding detector element

entering in a respective dosing chamber associated with the carousel to measure a

5

height reached by the quantity of pharmaceutical material in the dosing chamber.
